

Step 6: Detailed Design

Initial Due Date: Fifth Week

Final Due Date: End of Project

For this step your group will work out in detail the design of your app. You will use a diagramming tool like [balsamiq](#) (if you need a key for software usage, contact me), [mockflow.com](#), [draw.io](#) or just your favorite paint program. If you are building a game or other widget-free app then a paint program will be easier to use.

Your design should include:

The color scheme(s) for your app.

A diagram for all the major screens and dialogs of your app. Show all the widgets in their proper placement. Name each screen and write some text to explain how actions in one screen will lead to other screens.

In the case of a widget-free apps, you should include diagrams for all the major 'areas', animation stills that detail the most common animations (for example, Super Mario would have a set of drawings showing Mario jumping, punching up, and landing on a Goomba's head) and game mechanics, as well as story boards if they are more relevant to your game.

These design should show pixel dimensions.

A goal of the design is for you to think about the usability of your app. Try to 'use' the app in your mind: simulate how a user might use the app. Printing the screens into sheets of paper of the correct size and shuffling them as you pretend to use the app is a very common way to test the usability.

Another goal is to save you time. Remember that making a change now, like adding or deleting a screen, is 1000 times faster than if you wait until after you have written some code.

Deliverables

Export all your drawings as PNG files and add them to your report.

Add one page to your wiki called "Design" and put the screens with some textual description of each screen and what it is used for.
